

The Loop-to-Loop

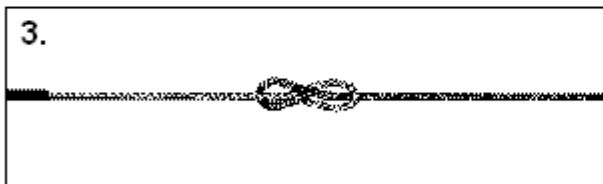

Use to connect two loops together

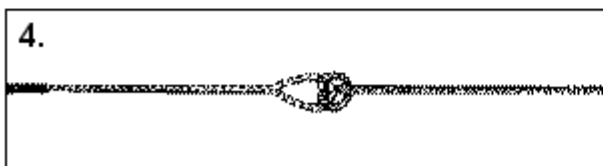

Pass the end of the fly line loop through the larger end of the leader butt loop.

Then pass the small end of the leader butt section through the fly line loop.

Tighten by pulling in opposite directions. You can disconnect the loops by pushing them toward each other and reversing the process. The correct loop-to-loop connection looks like a square knot when complete.

Incorrect loop-to-loop connection. Attaching the loops this way weakens the connection considerably.
